Diagnostic Shoulder Arthroscopy

Arthroscopic surgery allows diagnosis and treatment of joint problems through small incisions in the skin. A camera attached to a scope is used to see inside your joint.
Diagnostic Arthroscopy Introduction
Arthroscopic surgery allows diagnosis and treatment of joint problems through small incisions in the skin. A camera attached to a scope is used to see inside your joint.

Doctor's Personal Note: A Message From Your Doctor
Thank you for visiting our website and viewing our 3D Animation Library. These animations should assist you in better understanding your condition or procedure. We look forward to answering any additional questions you may have at our next appointment.

Incsions
Small incisions (portals) are made around the joint. The scope and surgical instruments will go into these incisions.

Visualization
The scope is inserted into the back of the shoulder. Saline solution flows through a tube (cannula) and into the shoulder to expand the joint and to improve visualization. The image is sent to a video monitor where the surgeon can see inside the joint.
Diagnosis
Using the video monitor as a guide, the surgeon can make a diagnosis. A variety of surgical instruments like this probe can be inserted through other incisions to treat specific problems.

End of Procedure
The surgical instruments are removed and the procedure is completed.
